2023 Water Quality Report for The Village of Lawrence

Water Supply Serial Number: 03820

This report covers the drinking water quality for the Village of Lawrence for the 2023 calendar year. This information is a snapshot of the quality of the water that we provided to you in 2022. Included are details about where your water comes from, what it contains, and how it compares to United States Environmental Protection Agency (U.S. EPA) and state standards.

Your water comes from 3 groundwater wells, each over 74ft deep. The State performed an assessment of our source water to determine the susceptibility or the relative potential of contamination. The susceptibility rating is on a seven-tiered scale from "very-low" to "very-high" based on geologic sensitivity, well construction, water chemistry and contamination sources. The susceptibility of our source was determined to have a moderate susceptibility to contamination.

There are no significant sources of contamination in our water supply. We are making efforts to protect our sources following EGLE required water sampling on all 3 wells, along with samples from the Distribution System.

If you would like to know more about this report, please contact: Carey Williams (269)384-9345 or cwilliams@perceptiveso.com. You may also contact Village Hall.

Contaminants and their presence in water: Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the U.S. EPA's Safe Drinking Water Hotline (800-426-4791).

Vulnerability of sub-populations: Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune systems disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. EPA/Center for Disease Control guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

Sources of drinking water: The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. Our water comes from wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria which may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- Inorganic contaminants, such as salts and metals which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture and residential uses.
- Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.
- Organic chemical contaminants, including synthetic and volatile organic chemicals which are by-products of industrial processes and petroleum

production and can also come from gas stations, urban stormwater runoff, and septic systems.

In order to ensure that tap water is safe to drink, the U.S. EPA prescribes regulations that limit the levels of certain contaminants in water provided by public water systems. Federal Food and Drug Administration regulations establish limits for contaminants in bottled water which provide the same protection for public health.

Water Quality Data

The table below lists all the drinking water contaminants that we detected during the 2023 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1 through December 31, 2023. The State allows us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. All the data is representative of the water quality, but some are more than one year old.

Terms and abbreviations used below:

- <u>Maximum Contaminant Level Goal (MCLG)</u>: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
- <u>Maximum Contaminant Level (MCL)</u>: The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.
- <u>Maximum Residual Disinfectant Level (MRDL)</u>: The highest level of a disinfectant allowed in drinking water.
 There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
- Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below
 which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of
 disinfectants to control microbial contaminants.
- <u>Treatment Technique (TT)</u>: A required process intended to reduce the level of a contaminant in drinking water.
- N/A: Not applicable
- ND: not detectable at testing limit
- ppm: parts per million or milligrams per liter
- <u>ppb</u>: parts per billion or micrograms per liter
- ppt: parts per trillion or nanograms per liter
- pCi/l: picocuries per liter (a measure of radioactivity)
- Action Level (AL): The concentration of a contaminant which, if exceeded, triggers treatment or other requirements that a water system must follow.
- <u>Level 1 Assessment</u>: A study of the water supply to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.
- <u>Level 2 Assessment:</u> A very detailed study of the water system to identify potential problems and determine (if possible) why an *E. coli* MCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

1 Monitoring Data for Regulated Contaminants

Regulated Contaminant	MCL, TT, or MRDL	MCLG or MRDLG	Level Detected	Range	Year Sampled	Violation Yes/No	Typical Source of Contaminant
Arsenic (ppb)	10	0	ro.	0-5	2019	o N	Erosion of natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes
Barium (ppm)	2	2	.15	.015	2016	o _N	Discharge of drilling wastes; Discharge of metal refineries; Erosion of natural deposits
Nitrate (ppm)	10	10	Q.	QN	2023	ON.	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Fluoride (ppm)	4	4	QN O	ND	2023	No	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Sodium¹ (ppm)	N/A	N/A	14.3	12 - 16	2023	No	Erosion of natural deposits
TTHM Total Trihalomethanes (ppb)	80	N/A	.0217	0- .0217	2023	o _N	Byproduct of drinking water disinfection
HAA5 Haloacetic Acids (ppb)	09	N/A	0.007	.00-07	2023	No	Byproduct of drinking water disinfection
Chlorine ² (ppm)	4	4	.54	.2873	2023	No	Water additive used to control microbes
Alpha emitters (pCi/L)	15	0	NA	NA	NA	No	Erosion of natural deposits
Combined radium (pCi/L)	52	0	NA	NA	NA	No	Erosion of natural deposits
Total Coliform (total number or % of positive samples/month)	F	N/A	N/A	N/A	2023	No	Naturally present in the environment
E. coli in the distribution system (positive samples)	See E. coli note ³	0	ND	N/A	2023	No	Human and animal fecal waste
Fecal Indicator – E. coli at the source (positive samples)	Ш	N/A	ND	N/A	2023	No No	Human and animal fecal waste

Sodium is not a regulated contaminant.

² The chlorine "Level Detected" was calculated using a running annual average.

³ E. coli MCL violation occurs if: (1) routine and repeat samples are total coliform-positive and either is E. coli-positive, or (2) the supply fails to take all required repeat samples following E. coli-positive routine sample, or (3) the supply fails to analyze total coliform-positive repeat sample for E. coli.

Year Violation Typical Source of Contaminant Sampled Yes/No	2023 Discharge and waste from industrial facilities No utilizing the Gen X chemical process	2023 No Discharge and waste from industrial facilities; stain-resistant treatments	2023 No Firefighting foam; discharge and waste from industrial facilities	No Firefighting foam; discharge and waste from industrial facilities	2023 No Discharge and waste from industrial facilities; breakdown of precursor compounds	No Firefighting foam; discharge from electroplating facilities; discharge and waste from industrial facilities	2023 No Discharge and waste from industrial facilities; stain-resistant treatments	Year Samples Typical Source of Contaminant Above AL	1/23 - Lead service lines, corrosion of household 6/30/23 0 plumbing including fittings and fixtures; Erosion of natural deposits	7/23- Corrosion of household plumbing systems; Erosion of natural deposits	Lead service lines, corrosion of household plumbing including fittings and fixtures; 12/31/23 0 Erosion of natural deposits

				THE STATE OF			

⁴ Ninety (90) percent of the samples collected were at or below the level reported for our water.

for drinking or cooking. If you have a lead service line, it is recommended that you run your water for at least 5 minutes to flush water from both your responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water Information about lead: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. home plumbing and the lead service line. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Village of Lawrence http://www.epa.gov/safewater/lead.

deficits in attention span and learning abilities. Adults who drink this water over many years could develop kidney problems or high blood pressure. Infants and children who drink water containing lead could experience delays in their physical or mental development. Children could show slight

time could experience gastrointestinal distress. Some people who drink water containing copper in excess of the action level over many years could Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of suffer liver or kidney damage. People with Wilson's Disease should consult their personal doctor.

Our water supply has 383 service lines of unknown material.

Monitoring and Reporting to the Department of Environment, Great Lakes, and Energy (EGLE) Requirements: The State of Michigan and the U.S. EPA require us to test our water on a regular basis to ensure its safety. We met all the monitoring and reporting requirements for 2023

We will update this report annually and will keep you informed of any problems that may occur throughout the year, as they happen. Copies are available at Village Hall. This report will not be sent to you. We invite public participation in decisions that affect drinking water quality to Monthly meeting held on the First Wednesday of each month at 6pm. For more information about your water, or the contents of this report, contact The Village of Lawrence. For more information about safe drinking water, visit the U.S. EPA at http://www.epa.gov/safewater. Notice of Violations for Water Quality Parameter Sampling 2023:

The Village was out of compliance for Water Quality Parameter (WQP) samples, between the dates of November 12 - 25, 2023. The Village is required to collect Water Quality Parameter samples every 2 weeks (EGLE sets the 2-week calendar for the sampling year) from all 3 wells that serve the Public Water Supply. During the Nov 12 – 25 dates, The Village collected the required samples from all 3 wells (results available). The Violation stemmed from missing information on the Chain of Custody for Well 4, resulting in EGLE not accepting Well 4 WQP results for compliance, and therefore resulted in a Violation for the Village. The residents were all sent a Violation Notice, that was provided by EGLE.

**Special Note: Early Reporting: This violation is not required to be reported until 2025, but in the spirit of transparency we will include it in this report. In July 2019 the State of Michigan implemented a Water Quality Parameters Testing Program for systems using Corrosion Control Treatment. (Treating Potable Water with Phosphate). During that time, EGLE collected sampling data from these WQP samples to set Acceptable Operating Ranges for the Village. During this time, the Village had difficulty keeping Phosphate Residual Levels at the EGLE required parameters (considerably below). The Village worked with EGLE and Elhorn Engineering to improve the Phosphate Treatment process. This process included a Phosphate Chemical change late in December of 2023. During this time, EGLE Implemented the Required Phosphate Residual Parameters (beginning January 1, 2024), anything outside of set parameters would be a Violation. PO4 residual had to be at least above 1.5 ppm and PH was to be above 7.0. The Village asked for an extension of the set parameters since we were in the process of changing Phosphate chemicals (previous test and data collected showed the Village would reach the Required Parameters of PO4). EGLE denied our request for an extension. During the time frame of the old Phosphate residual leaving the system, and the new Phosphate taking over, the Village was below the required PO4 residual, which resulted in a Treatment Technique Violation the 1st 2 weeks of January. Since the new PO4 chemical is in place, the Village has "Met & Maintained" all required Phosphate Residual Parameters.
